Twist-Lock Storm Panel Clips
Installation Instructions
Customer Installed 3D Printed Snow/Storm Panel Clips

Parts ID

1. Clip Body

2. Retainer Slot

3. Top

4. Base

Wire Slot

Rounded side of clip body opposite rounded side of retainer.

Repeat procedure for all of your storm panels.

Clips are designed to be left on panels once installed.

Place with clip body top pointing up at 12:00 noon.

Note: Panels cover only about 97% of the opening to account for materials and positioning variance.

3. Place clip body through hole in storm panel and force retainer into retainer slot starting from base side of clip body. Rounded side of body will be opposite of rounded side of retainer.

Clicking sound will be heard when retainer is pushed all the way into the retainer slot.

5. Position storm panel onto wire of coop panel such that clip body with top at 12:00 Noon slips through an opening in the welded wire. Clip will slide a little in each direction to accommodate aligning with an opening in the wire.

Twisting clip to 3:00 (clockwise 90°) locks the clip into place. Twisting counter clockwise back to 12:00 noon unlocks clip.

Scan QR code or visit the Urban Coop Company Channel on YouTube for an instructional video.

V6 Sept 2019
Retrofit Instructions

Using clips to supplement magnetic panels where sub zero blizzard wind gusts could reach tropical storm force (40-74 mph) and blow a magnetic panel off.

Leave magnets in place. With your existing panel in place, use a marker to mark the center of a hole in the wire where you intend for the supplemental Twist Lock Clip to be installed. If you have a Walk-In style coop, do it from inside. If not, just look through panel from outside and mark the spot in the center of a wire opening.

See below for recommended placement suggestions. One clip will hold smaller and medium sized panels in place, on the largest panels, you can install two.

Lay the panel flat onto a scrap piece of wood or a cutting block. You’ll be making a 3/4” hole over the mark you made in step 1. We suggest using a 3/4” General Tools Steel Punch which you can purchase online for between $10-$20. Use your tool to create the 3/4” hole. You could also cut or carve the hole with a sharp knife but the punch will make a more perfect hole.

Next - Follow the instructions on the front side to install the clip after making the hole.

Note: Drilling hole with a drill bit will most likely shatter your storm panel.

Suggested placement of Twist Lock Clips for supplemental attachment of magnetic style panels.
